ADAPTING QUICKLY TO CHANGING TIMES

At the Fulda-based (Hesse, Germany) Druckerei Rindt, every job is treated differently and there is no such thing as 'technically too demanding'. The key performance parameters are all those that make production efficient and profitable. But whether it is producing sophisticated covers which are printed in up to five colours or implementing the latest technology solutions, the basics are not forgotten at the facility founded in the 1930s. Such as this picture, showing press operator Andreas Kaup supplementing inline quality control with more traditional means, suggests. The story (see page 41) also shows how old printing establishments can adapt to changing times, using technology wisely.
Keeping your finger on the pulse of the customer

Customer is King – the raison d'être of every business. It is therefore imperative for all businesses to listen to their customers, says Varsha Chitale

Over the years, the NPS has gained popularity, as companies have observed a close correlation between the NPS and growth rates of companies. Those who have higher customer loyalty (as measured by NPS) have grown faster. A large number of global companies across industries such as industrial goods, retail, telecom, transportation, etc, including top brands such as Apple, Samsung, Sony, eBay, Delta and BBC, use the NPS.

Many organisations have also customised the NPS to suit their needs. Some use 5 or 7 point scales. There are also cultural variations in how generous respondents are in giving scores, and the scales and calculations can be adjusted to allow for these differences.

The advantage of NPS is that it is simple to administer as well as calculate and gives a quick insight into the level of customer loyalty. The NPS does have few shortcomings, however. A single number is an indicator, but gives no actionable insights at all. It doesn’t tell you what you can do to improve your performance. It therefore needs to be accompanied by further probing, particularly for respondents who have given low scores, so that the company can understand what corrective action is needed. Also, it doesn’t distinguish between scores within the ranges. So a score of ‘0’ is treated at par with a score of ‘6’, when in fact they are quite far apart. Nevertheless, NPS is a key tool for customer intelligence. It enables you to keep your finger on the pulse of your customer.
